Using Filter

Table of Contents

stdin, stdout, stderr

Filters

- Commands:
 - o cat, tee, grep, cut, tr, wc, sort, uniq, comm
- Control Operators

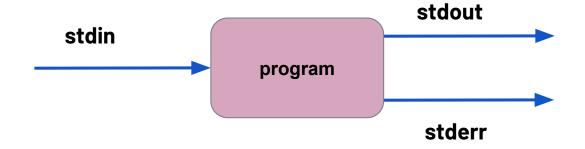

stdin, stdout, stderr

stdin, stdout, stderr

Filters

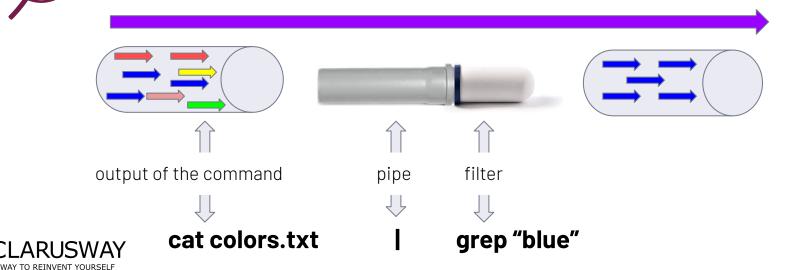

Filters

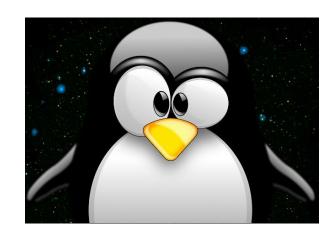

A filter is a program that takes data from one command, does some processing and gives output. Filter commands generally are used with a **pipe**.

Pipe ('|') is a mechanism that send the output of one command as input of another command.

- ➤ tee
- ➤ grep
- > cut
- > tr
- > wc
- > sort
- > uniq
- > comm

cat

When between two pipes, the cat command does nothing (except putting stdin on stdout). Displays the text of the file line by line.

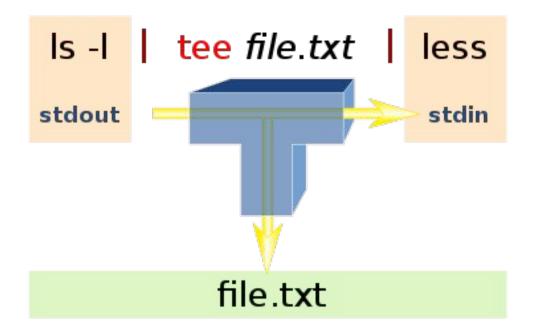

```
ubuntu@clarusway: $ cat days.txt
sunday
monday
tuesday
wednesday
thursday
friday
saturday
ubuntu@clarusway: $ cat days.txt | cat | cat | cat | cat
sunday
monday
tuesday
wednesday
thursday
friday
saturday
ubuntu@clarusway: $ _
```

tee

tee is almost the same as cat, except that it has two identical outputs.

grep

The most common use of grep is to filter lines of text containing (or not containing) a certain string.

```
ubuntu@clarusway: $ cat tennis.txt
Amelie Mauresmo, Fra
Justine Henin, BEL
Serena Williams, USA
Venus Williams, USA
ubuntu@clarusway: $ cat tennis.txt | grep Williams
Serena Williams, USA
Venus Williams, USA
ubuntu@clarusway: $
```

cut

The cut filter can select columns from files, depending on a delimiter or a count of bytes

cut -d(delimiter) -f(columnNumber) <fileName>

```
user@clarusway-linux:~$ ls *.* -l
-rw-r--r-- 1 user user 16 Mar 2 21:56 classes.html
-rw-r--r-- 1 user user 8980 Mar 2 21:53 examples.desktop
-rw-r--r-- 1 user user 24 Mar 2 23:22 html.txt
-rw-r--r-- 1 user user 17 Mar 2 22:42 lesson.txt
-rw-r--r-- 1 user user 13 Mar 2 23:22 linux.txt
-rw-r--r-- 1 user user 0 Mar 4 21:42 xtml.txt
user@clarusway-linux:~$ ls *.* -l | cut -d' ' -f3
user
user
user
user
user
user
user@clarusway-linux:~$
```

The command 'tr' stands for 'translate'.

It is used to translate, like from lowercase to uppercase and vice versa or new lines into spaces.

```
ubuntu@clarusway: $ cat clarusway.txt
Way to Reinvent Yourself
ubuntu@clarusway: $ cat clarusway.txt | tr 'aer' 'iou'
Wiy to Roinvont Youusolf
ubuntu@clarusway: $ cat count.txt
one
two
three
four
five
ubuntu@clarusway: $ cat count.txt | tr '\n' ' '
one two three four five ubuntu@clarusway: $
```

WC

Counting words, lines and characters is easy with wc.

```
    wc <fileName> (Counts words, lines and characters)
    wc -l <fileName> (Counts only lines)
    wc -w <fileName> (Counts only words)
    wc -c <fileName> (Counts only characters)
```

```
ubuntu@clarusway: $ cat count.txt
one
two
three
four
five
ubuntu@clarusway: $ wc count.txt
 5 5 24 count.txt
ubuntu@clarusway: $ wc -1 count.txt
5 count.txt
ubuntu@clarusway: $ wc -w count.txt
5 count.txt
ubuntu@clarusway: $ wc -c count.txt
24 count.txt
ubuntu@clarusway: 💲 🛌
```

14

sort

The sort filter will default to an alphabetical sort.

sort -r	the flag returns the results in reverse order
sort -f	the flag does case insensitive sorting

```
ubuntu@clarusway: $ cat marks.txt
John-10
James-9
Aaron-8
Oliver-7
Walter-6
ubuntu@clarusway: $ sort marks.txt
Aaron-8
James-9
John-10
Oliver-7
Walter-6
ubuntu@clarusway: 💲 📥
```

uniq

With the help of uniq command you can form a **sorted list** in which every word will occur only once.

```
ubuntu@clarusway: $ cat marks.txt
John
James
Aaron
Oliver
Walter
Aaron
John
James
John
John
ubuntu@clarusway: $ sort marks.txt | uniq
Aaron
James
John
Oliver
Walter
ubuntu@clarusway: 💲 🗕
```

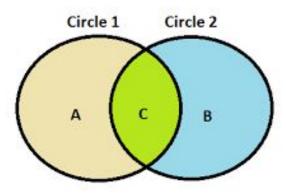

comm

The 'comm' command compares two files or streams. By default, 'comm' will always display three columns.

First column indicates non-matching items of first file, second column indicates non-matching items of second file, and third column indicates matching items of both the files.

Both the files has to be in sorted order for 'comm' command to be executed.

1. Create a file named countries.csv with the following content

Country,Capital,Continent
USA,Washington,North America
France,Paris,Europe
Canada,Ottawa,North America
Germany,Berlin,Europe

- 2. a. Cut only "Continent" column
 - b. Remove header
 - c. Sort the output
 - d. List distinct values
 - e. Save final output to "continents.txt" file
- 3. Display content of continents.txt file

4

Using Control Operators

Table of Contents

Control Operators

- Semicolon (;)
- Ampersand (&)
- Dollar Question Mark (\$?)
- Double Ampersand (&&)
- Double Vertical Bar (||)
- Combining && and ||
- Pound Sign (#)
- Escaping Special Characters (\)
- End of line Backslash

We put more than one command on the command line using control operators.

Control Operator	Usage
; semicolon	More than one command can be used in a single line.
& ampersand	Command ends with & and doesn't wait for the command to finish.
\$? dollar question mark	Used to store exit code of the previous command.
&& double ampersand	Used as logical AND.
double vertical bar	Used as logical OR.
Combining && and	Used to write if then else structure in the command line.
# pound sign	Anything was written after # will be ignored.

Semicolon (;)

You can put two or more commands on the same line separated by a **semicolon (;)**

```
ubuntu@clarusway: $ cat days.txt
sunday
monday
tuesday
wednesday
thursday
friday
saturday
ubuntu@clarusway: $ cat count.txt
one
two
three
four
five
ubuntu@clarusway: $ cat days.txt ; cat count.txt
sunday
monday
tuesday
wednesday
thursday
friday
saturday
one
two
three
four
five
ubuntu@clarusway: $ 🛶
```

When a line ends with an ampersand &, the shell will not wait for the command to finish. You will get your shell prompt back, and the command is executed in background. You will get a message when this command has finished executing in background.

```
ubuntu@clarusway: $ sleep 20 &
[1] 3396
ubuntu@clarusway: $
[1]+ Done sleep 20
ubuntu@clarusway: $
```

- Look at the above snapshot, command "sleep 20 &" has displayed a message after 15 seconds.
- Meanwhile, in the shell prompt, we can write any other command.

Dollar Question Mark (\$?)

This control operator is used to check the status of last executed command. If status shows '0' then command was successfully executed and if shows '1' then command was a failure.

```
buntu@clarusway: $ 1s
               count.txt days.txt file1.txt file2.txt
                                                              key.txt
                                                                           keypc.pem marks.txt tennis.txt
clarusway.txt days
                          file1
                                    file2
                                               get-docker.sh key.txt.pub keypc.pub temp.txt
ubuntu@clarusway: $
ubuntu@clarusway: $ echo $?
ubuntu@clarusway: $ rmdir *
rmdir: failed to remove 'Repo': Directory not empty
rmdir: failed to remove 'clarusway.txt': Not a directory
rmdir: failed to remove 'count.txt': Not a directory
rmdir: failed to remove 'days': Not a directory
rmdir: failed to remove 'days.txt': Not a directory
rmdir: failed to remove 'file1': Not a directory
rmdir: failed to remove 'file1.txt': Not a directory
rmdir: failed to remove 'file2': Not a directory
rmdir: failed to remove 'file2.txt': Not a directory
rmdir: failed to remove 'get-docker.sh': Not a directory
rmdir: failed to remove 'key.txt': Not a directory
rmdir: failed to remove 'key.txt.pub': Not a directory
rmdir: failed to remove 'keypc.pem': Not a directory
rmdir: failed to remove 'keypc.pub': Not a directory
rmdir: failed to remove 'marks.txt': Not a directory
rmdir: failed to remove 'temp.txt': Not a directory
rmdir: failed to remove 'tennis.txt': Not a directory
rmdir: failed to remove 'testdir': Directory not empty
ubuntu@clarusway: $ echo $?
ubuntu@clarusway: $
```

Double Ampersand (&&)

The command shell interprets the && as the logical AND. When using this command, the second command will be executed only when the first one has been successfully executed.

```
ubuntu@clarusway: $ cat days.txt && cat count.txt
sunday
monday
tuesday
wednesday
thursday
friday
saturday
one
two
three
four
five
ubuntu@clarusway: $ cd Repo && ls
ubuntu@clarusway:
```

The command shell interprets the (||) as the logical OR. This is opposite of logical AND. Means second command will execute only when first command will be a failure.

```
ubuntu@clarusway: $ cat days.txt || echo "clarusway" ; echo one
sunday
monday
tuesday
wednesday
thursday
friday
saturday
ubuntu@clarusway: $ zecho days.txt || echo "clarusway" ; echo one
Command 'zecho' not found, did you mean:
  command 'aecho' from deb netatalk
  command 'echo' from deb coreutils
Try: sudo apt install <deb name>
clarusway
ubuntu@clarusway: $ _
```

You can use this logical AND and logical OR to write an if-then-else structure on the command line. This example uses echo to display whether the rm command was successful.

```
ubuntu@clarusway: $ cat file1
Aaron
James
John
Oliver
Walter
ubuntu@clarusway: $ rm file1 && echo It worked! || echo It failed!
It worked!
ubuntu@clarusway: $ rm file1 && echo It worked! || echo It failed!
It worked!
ubuntu@clarusway: $ rm file1 && echo It worked! || echo It failed!
rm: cannot remove 'file1': No such file or directory
It failed!
ubuntu@clarusway: $ _
```

Everything written after a pound sign (#) is ignored by the shell. This is useful to write a shell comment but has no influence on the command execution or shell expansion.

```
ubuntu@clarusway: $ mkdir test # We create a directory
ubuntu@claruswav: $ cd test # We enter the directorv
ubuntu@clarusway: $ 1s # is it empty ?
ubuntu@clarusway: $
```

Escaping Special Characters (\)

Escaping characters are used to enable the use of control characters in the shell expansion but without interpreting it by the shell.

```
ubuntu@clarusway: $ echo this is \* symbol.
this is * symbol.
ubuntu@clarusway: $ echo this \ \ \ \is \ \ \ \clarusway.
this is clarusway.
ubuntu@clarusway: $ echo escaping \\\ \#\ \&\ \"\ \'
escaping \ # & " '
ubuntu@clarusway: $ _
```

Lines ending in a backslash are continued on the next line. The shell does not interpret the newline character and will wait on shell expansion and execution of the command line until a newline without backslash is encountered.

```
ubuntu@clarusway: $ echo This command line \
> > is split in three \
> > parts
ubuntu@clarusway: $ This command line is split in three parts
```

Kahoot

Exercise

- 1. a. Search for "clarusway.txt" in the current directory
 - b. If it exists display its content
 - c. If it does not exist print message "Too early!"
- 2. Create a file named "clarusway.txt" that contains "Congratulations"
- 3. Repeat Step 1

Exercises

```
Is -I | cut -d' ' -f3
Is -I | tee output.txt | cut -d' '-f3
Is -I | cut -d' ' -f3 | tee output.txt
cat file.txt | tr 'a' 'W'
                                        cat file.txt | tr 'a' 'W' | file.txt
cat /etc/passwd | cut -d' '-f1 | wc -l
cat tennis players.txt | sort
                                                  cat tennis players.txt | sort -r
info ls | tee ls exp.txt
                                             cat /etc/passwd | cut -d' ' -f3 | uniq | wc -l
```

Homework

diff

diff (1)

- compare files line by line

diff (1p) - compare two files

https://www.geeksforgeeks.org/diff-command-linux-examples/#:~:text=diff%20stands%20for%20difference.,make%20the%20two%20files%20identical.
